Claim 6; Fig 13B; 45pp; English.

A CDNA clone (762843) codes for a novel human oestrogen recepto: A cDNA clone (762843) codes for a lesignated ER-beta. It was isolated from a human testis cDNA library using rat ER-beta cDN (see also T62842) as probe. The human ER-beta gene was mapped to chromosome 14 region 14922-23. Rat, human and mouse ER-beta (W14723-25) can be used to isolate molecules for use in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1501

DNA encoding estrogen recidentify novel ligands of Claim 5; page 13-14; 45pg
                               DNA encoding estrogen receptor - useful in screening assay to identify novel ligands or hormonal analogues Claim 5; Page 13-14; 45pp; English.

This sequence encodes a novel osstrogen binding protein. The cDNA sequence which encodes this protein can be alternatively spliced resulting in the detection of additional transcripts (see T88413). This receptor is able to bind and be activated by estradiol, estone estriol, can be used in a screening assay for the identification of drugs e.g. novel ligands or hormonal analogues.

                                                                                                                                                                           DNA encoding estrogen receptor - useful in screening assay to identify novel ligands or hormonal analogues

PS Claim 5; Page 14-15; 45pp; English.

CC This partial sequence encodes a splice variant of a novel oestrogen binding protein, detected by screening a human testis cDNA library.

CC binding protein, detected by screening a human testis cDNA library.

CC this protein contains an alternative exon 8 (exon 8B) of the novel contains an alternative exon 8 (exon 8B) of the novel contains an alternative splicing reaction, the reading frame encoding the novel receptor is immediately terminated, creating a truncation of the carboxy terminus of the novel receptor.

CC This novel receptor is able to bind and be activated by estradiol, estone and estriol, and can be used in a screening assay for the identification of new drugs e.g. novel ligands or hormonal analogues, however this contain the contain an AF-2 region and therefore probably lacks the ability to modulate transcription of target genes in a ligand dependent

This sequence encodes splice variant of a novel cestrogen binding protein isolated from human thymus tissue. This protein contain an alternative exon 8 (exon 8C) of the novel cestrogen receptor represented in T88412.

This novel receptor is able to bind and be activated by estradiol, estone and estriol, can be used in a screening assay for the identification of new drugs e.g. novel ligands or hormonal analogues. This variant does not contain an AF-2 region and therefore probably lacks the ability to modulate transcription of target genes in a ligand dependent fashion.

A cDNA clone (76.842) codes for a novel rat oestrogen receptor. A set of related nuclear receptor (W13723), designated ER-beta. A set of degenerate primers based on conserved sequences of the DNA-binding domain and ligand binding domain of nuclear receptors were used to amplify rat prostate cDNA. The PCR prod. was used to screen a rat prostate cDNA library to obtain the ER-beta cDNA. This was then used to obtain human ER-beta cDNA (see also 76.8843) from a human testis cDNA library. Rat, human and mouse ER-beta (W14723-25) can be used to isolate molecules for use in the treatment of cardiovascular diseases, central nervous system of diseases, osteoporosis, prostate or ovarian cancer or benign prostatic hyperplasia and to test environmental chemicals for coestrogenic activity.

A cDNA clone (T62844) codes for a novel mouse oestrogen receptor-
related nuclear receptor (W13725), designated ER-beta. Rat, human
and mouse ER-beta (W14723-25) can be used to isolate molecules for
use in the treatment of cardiovascular diseases, central nervous
system diseases, osteoporosis, prostate or ovarian cancer or benign
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         08-SEP-1995;

The construct was transfected into eukaryotic cells expressing the tTA transactivator (T06867) to allow tetracycline-regulated expression of the receptor. The minimal promoter PhCMV*-1 is based on the human CMV intermediate-early promoter (with enhancer region remover to a tetracycline operator, teto. The promoter is used express tTA transactivator in host cells. In clone pUHD (given in 076269), CDNA for rabbit progesterone receptor the control of PhCMV*-1.

Disclosure; Fig. 1-1 - 1-2; 26pp; English.

The cDNA can be used in an expression system to express human oestrogen receptor protein. The coding sequence is operably linked control sequences compatible with eukaryotic host cells. This metho allows expression under conditions which favour appropriate post-translational processing. It produces large amts. of purified prote useful in the design of agonist and antagonist cpds., for the study the mechanism of action of the steroid binding proteins in general, and for use in diagnostic assays for the proteins or antibodies to them. These assays are important in, eg the diagnosis of tumour sensitivities to steroid metabolism. Suitable host cells are VERO, HeLa and CHO cells.

It is disclosed in the patent specification. The invention concerns an EAR-1r gene (human erb-A related gene) encoding a nuclear receptor protein (R71565) derived from human osteosarcoma (HOS) cells. The expression of EAR-1r is most abundant in the brain and was detected slightly in heart and placenta. The receptor protein may be used for the investigation of generation, differentiation and growth of fat soluble physiological substances. Sequence 204 BP; 59 A; 46 C; 55 G; 44 T;

PT Screening pigs for high litter size - by identifying a polymorphism

PT in the pig oestrogen receptor gene in a DNA sample

Screening pigs for high litter size - by identifying a polymorphism

PT in the pig oestrogen receptor gene in a DNA sample

CC This is a fragment of the pig oestrogen receptor (ESR) gene including

CC This is a fragment of the pig oestrogen receptor (ESR) gene including

CC exon 3. The sequence covers the region contg. a polymorphic PvuII

CC restriction enzyme site which is used as site for determining the ESR

CC allele carried by the animal. Restriction fragment length polymorphism

CC allele carried by the increased pig litter size dependent on the company of the pigs of this region revealed two alleles of 4.3 and 3.7 kb.

CC Both alleles are involved with increased pig litter size dependent on the company of the pigs born in each litter and company of the pigs born in each litter and company of the pigs born alive than pigs with the 4.3 kb allele. The allele can also be determined by PCR using the primers (T42194-T42201).

They can also be used in diagnostic assays. Also claimed is pure DNA encoding oestrogen-related receptors hERR1 and hERR2 and hERR2. The new hERR1 and hERR2 receptors will provide the basis for development of an assay system that will lead to the identification of novel hormones.

                                                                                                                                                                                                                                         promoter linked to tet operon, and vectors and cells where gen expression is regulated by tetracycline Disclosure; Fig 9A-C; 37pp; English.

CDNA coding for the rabbit progesterone receptor was placed un control of the PhCMV*-1 promoter (see T06869), resulting in tetracycline-regulated expression vector pUHDpgr-3 contg. the sequence given in T06872. The construct was transfected into eukaryotic cells expressing the tTA transactivator (T06867) to allow tetracycline-regulated expression of the receptor.

The minimal promoter PhCMV*-1 is based on the human CMV intermediate-early promoter (with enhancer region removed), fused to a tetracycline operator, teto. The promoter is used to express tTA transactivator in host cells. In clone pullb BGR3 (given in Q76269), CDNA for rabbit progesterone receptor is under the control of PhCMV*-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Buldard H, Gossen M;
